Opening Files Within A BPL

I have two files that I ultimately need to combine. The first file contains data from a PO. The second file contains tracking information. What I thought about doing was create a BS that grabs the first file, loads it into a record map and transfers it to a BPL. Then, the BPL would open the second file where I would write code to load the file into a second record map and then insert the tracking information to the correct places in the first file based on PO line items.

First, is this the best approach? Second, how do I open the second file in the BPL? I assume I would have to open and load the file to a stream, but am unsure how to perform this task.

Any help would be greatly appreciated. Thanks.
