I keep getting ERROR #6159 when trying to read in a WSDL file from the server

I am using the SOAP Wizard in Studio to try to read in a WSDL file that is physically on our HealthShare server. I keep getting the same error:

ERROR #6159: Although HTTPS is turned on no SSLConfiguration is specified so unable to make an HTTPS connection.

As I am not trying to connect via HTTP (and I don't see anywhere to add an SSL connection), I am not sure what I am doing wrong.

Any suggestions & solutions gratefully accepted.

Error Reading WSDL

ERROR #6159: Although HTTPS is turned on no SSLConfiguration is specified so unable to make an HTTPS connection.

This error can occur if the WSDL server requires you to provide a user name and password.
If the WSDL server is a CACHE server, enter a suitable CACHE user name and password and try again:
If the WSDL server requires HTTP authentication, enter a suitable user name and password for HTTP authentication and try again:

☒ CACHE user name and password
☐ HTTP authentication user name and password

Username: Password:

Note that errors can also occur for other reasons. For example, the server could require an SSL connection or the WSDL might not be a valid XML document.

Step 2 - The WSDL you have selected is displayed below. If this is correct, select options as wanted and press **Next**.

Options to control class generation and compilation: *

☒ Create Client for Web Service
☐ Create Web Service

☒ Compile generated classes Compile flags:

Class Type: ☐ Persistent
 ☐ Persistent using one-many relationships
 ☐ Persistent using indexed one-many relationships
 ☐ Persistent using parent-child relationships
 ☒ Serial

☒ Create Business Operation
Business Operation Package
Request Object Package
Response Object Package

Proxy Class Package

WSDL Document: E:\TEST\Graphnet\WSDL\MessagingService.wsdl

```
