ECP status via \$system.ECP

Hi,

I'm trying to get the ECP status of 2 servers using \$system.ECP.GetProperty("ServerStats") and \$system.ECP.GetProperty("ClientStats"), but I'm not able to find the documentation of the values returned:

For example, on the server side I execute this:

```
USER>w $system.ECP.GetProperty("ServerStats")
14973692,14965389,15903851,2482140,12941,306696,0,0,613392,0,9767,7,10,0,2,0,896,0,180883896,19439345
12,0,2444,0,0,12215838,8204,43,0,40,40,0,0,0,8585,82238,1,4,19825,4387,3926,3059,4813,3368,5456,37412,82
04,12215838,2,8760,2,87963,0,3,2290946,180615,28945,0,18366,0,499250,128761,137048,1592639,0,306514,1
76,6,0,0,0,0,0,0,0,0,381,0,0,0,96764,389154,0,5203,0,0,0,12607663,28,2357698,2709,5459,135,0,0,0,30669
6,0,306696,9784,306696,0,0,0,19,0,3,0,0,0,1109,0,0,265,0,0,
```

But I have no clue of what are the concepts behind the values. Any ideas?
