How to get 'AlertGroups' property from business process' configuration?

In a HTTP operation, which extends `Ens.BusinessOperation`, `EnsLib.REST.Operation`, one can read the component's `AlertGroups` property by simply referring to it with `..`:

```
set AlertGroup = ..AlertGroups
//Do something with AlertGroup
```

"AlertGroups" is a property of `Ens.Host`. The above however does not work in a business process which Extends `Ens.BusinessProcessBPL` which extends `Ens.BusinessProcess` which extends `Ens.Host`. Can this property be read from inside the business process and what would the syntax be?

How to get 'AlertGroups' property from business process' configuration?

Published on InterSystems Developer Community (<https://community.intersystems.com>)

As the end result I would like to include the component's AlertGroups property's value to an alert I generate in BPL when certain conditions match:

The image shows a Business Process (BPL) configuration interface. On the left, a flowchart contains an if-activity labeled 'ONGELMA?' with the condition '<if>'. A callout box explains the condition: 'Jos REST-operaatio pal: jotain meni pieleen kun'. The 'true' path leads to an alert activity (a yellow circle with an exclamation mark) labeled '<alert>'. A callout box points to this activity with the text '.AlertGroup'. The 'false' path leads to a break activity labeled '<break>' with the text 'Lopeta FOREACH'. On the right, the configuration panel for the '<alert>' activity is shown. It includes tabs for 'General', 'Context', 'Activity', and 'Preferences'. The 'Activity' tab is active, showing the following configuration:

- Name: ALERT
- Caption for shape: (empty)
- Position of shape: x=335, y=1000, Disabled checkbox is unchecked.
- Annotation: Send value from component's "AlertGroups" property as part of alert text
- Value: context.getProviderScheduleResponse.Error (highlighted with a green box)
- Value passed along with the alert: (empty)
