## Temporary Tables in InterSystems IRIS

Temporary tables are tables available for a current process only (and destroyed when process ends).

What are you approaches to creating temporary tables? Here's the two I know:

- 1. <u>Process-private Globals storage</u> can be used as a data global in storage definition. That way, each process can have its own objects for the class with ppg storage. <u>Here's how</u>. <u>Here's how</u> 2.
- 2. InterSystems TSQL supports #tablename temporary tables. A #tablename temporary table is visible to the current procedure of the current process. It is also visible to any procedure called from the current procedure. #tablename syntax is only supported in TSQL procedures (class methods projected as procedures with language tsql).

Any other ways to achieve similar functionality?
