How to create a REST web application using a Installer manifest

Just like the title says, I'm attempting to find a way to create a web application that instead of serving CSP files, it uses a dispatch class.

I searched for clues in the documentation, but the CSPApplication tag seems to be exclusively for CSP file-based applications.

I'm trying to avoid implementing a workaround such as using the Invoke tag to call the Security.Applications to generate the web application but I might be forced to do so, even though it's unpleasant if I had to say...

So, is there an official way to execute this task?
