Can you have a custom %Status object without the error code in the $SYSTEM.Status.GetErrorText(sc) output ?

There does not seem to be any separation between the error code and error text in a %Status object. For custom errors, I simply want to display the message and not Error #5001: Some error text.

```
ClassMethod
        IsNonNullCustomerID
                (pCustomerID
                        As
                                %String
                                ) As
                                        %Status {

Quit
 :pCustomerID
        =""
        )
                $$$ERROR
                        ($$$GeneralError
                                ,"CustomerID is not valid"
                                        )

Quit
    $$$OK
```

The various methods described here to retrieve the error text always show
Error #5001: CustomerID not valid

Without manipulating the string above, can you get the "CustomerID not valid" message cleanly from the %Status object and in as few lines of code as possible?
