Adding Resources to a Newly Created Role

I am attempting to pragmatically create a bunch of roles and then assign the appropriate resources to that role.

Currently, the only ways to add resources to a role are to:

1. Do through Management Portal
2. Go through ^SECURITY (add resource one at a time)

My Intention would be to do the following: do ^SECURITY Role Setup Edit Role When prompted for resources to add, be able to use *

Additionally, I was thinking that an additional method can either exist (that I seem to can't find) or create a new method called AddResources: ##Class(Security.Roles).AddResources("role name", "resources to add [can use * for all]")

Any thoughts or maybe another way to work around this?
