## Cannot type password in Terminal

I just tried to log into our QA server and connect to Terminal (v 2013.1).

I can type in my username but when I attempt to type my password, no characters are typed. When I press ENTER the password is invalid.

I can connect to the management portal and the studio development environment without any problems. Also, I do not have this problem when connecting to the terminal in our production environment (2010).

Does anyone know what can cause this type of problem?

Thanks.
