What does <NETWORK DATA UPDATE FAILED - MAXSTRING> mean?

The intersystems documentation gives the same description for both <MAXSTRING> and <NETWORK DATA UPDATE FAILED - MAXSTRING>. I suspect that the description for <MAXSTRING> is correct and the description for <NETWORK DATA UPDATE FAILED - MAXSTRING> was an accident. I would like to know what situation triggers the <NETWORK DATA UPDATE FAILED - MAXSTRING> error.

If I had to guess, I would say it means that a MAXSTRING error occurred on the data server while it was attempting to process a request from the app server; instead of sending back the expected response, the data server sends back something that triggers the <NETWORK DATA UPDATE FAILED - MAXSTRING> error on the app server. That's just a guess, though. Can someone tell me for certain what <NETWORK DATA UPDATE FAILED - MAXSTRING> means?
