Iris Contest FileMailer Application

Hello,

I got the idea for this application, because for my work we have a process that currently uses legacy Vista code called MailMan to transfer files using email. I thought I could create a process in HealthConnect (IRIS Interoperability) to replace the need for having the legacy code. I have seen File Passthrough and TCP Passthrough Operations that can transfer a stream (file content) into a file or through TCP connection. I did not find Email Passthrough Operation, so I decided to create it. It receives request with a stream that has the content of the file. I want it to send an email message where the file content goes into the body of the message.

Challenge was I could not send email from my IRIS container, because I have no email server yet. Today I got a different error when I worked on my laptop (not Docker) which I posted to the community.

More to follow...

Oliver
