## ZPM: questions about private usage

Hello,

We're considering adopting the ZPM solution as a way to manage many of our customer updates. However in order to do so we need to know a few things.

- Is ZPM client compatible with Caché 2017.x versions?
- Can we configure a self-hosted registry that doesn't require a GitHub repository link?
- Could the ZPM client zip and upload the whole package (all classes, routines, includes) instead of [downloading](#) it from a Github link?
- Can we declare a module that specifies classes themselves instead of their [package](#) counterpart? e.g. My.Class.CLS instead of My.PKG.

We need all these questions to have positive replies otherwise we won't be able to use it.
