Tip about consuming a service from IRIS container using Business Operation

I have Mac OSX and Docker Desktop 2.2 (Engine 19.03).

I have a REST service running on my localhost (Mac) and I was trying to consume it from IRIS running in a Docker container.

If you try something like that don't use localhost as HTTP Server setting (using a Business Operation for example).

You have to use host.docker.internal. See this:

<https://docs.docker.com/docker-for-mac/networking/#use-cases-and-workarounds>

Hope this helps !
