What causes a dead job alert and How to trace a dead job alert

DeadJobAlert: Job 'X478915' for config item 'Business Service' was marked as 'dead' under ghost Id 'sys:ZX4789156117'

This is the error message I get, but can you advice how can I start debugging this? I look at the jobs and I just see "dead" I cant see any information on the message itself.

I would appreciate if you could advice on how to start debugging such a job. Events are also non-informative.
