%Stream.Object.1.INT doesn't exist on server

So, I was doing a debug test on a routine, and tried to open a file (yes, it does exist) as so:

```
s file=##class(%File).%Open($$airfile,"R")
```

And, I got the above-mentioned error. It begins with "cniptcp://localhost:56775/%Stream.Object.1.INT" in case the port means anything.

This is a single-license version of Cache 2017.2, which I installed about three years ago. You would think I'd have the .INT files, but I don't. Oh, one other oddity: I can't seem to compile the routine, despite having admin privs for the machine. It's Windows 7 64-bit.

Any help is appreciated.
