Scheduled Task User privilege

Hi,

I've started to use **Task Schedule** function in Caché. But I have two questions about it:

1. I want to run the *task* as an indepedent, technical user. What is the minimum resources for this user to successfully run the defined *task*.
2. I disabled the built in user S Y S T E M , as the [Tightening Security for an Instance](#) article suggest. But I see that built in task run in the name of S Y S T E M user. For example Switch Journal. How can this work, if the user disabled? Should I use another user for this tasks?

Thanks!
