Help on WebTerminal performance

Running WebTerminal from [OpenExchange](#) over HTTPS could be a very secure access method for remote developers.

So I was asked to compare it to other access tools.

One of the tests was display speed. So from the command prompt, I did a simple ZWRITE ^SYS

I started it in parallel: WebTerminal, IRISterminal, Putty

- PuTTY completed first, though started last
- IRISterminal took some time longer but ended somewhat later
- WebTerminal first chopped the output but was then incredibly slow.

So I feel I missed some important settings in installation.

I just couldn't find any related hint in the docs. (BuerSizes, Switches, ...)

What are your suggestions?
