Routing Rule - Syntax Error

Cache for UNIX (IBM AIX for System Power System-64) 2018.1.3 (Build 414U) Mon Oct 28 2019 11:24:02 EDT [HealthShare Modules:Core:15.032.9026 + Linkage Engine:15.032.9026]

We had an odd situation come up last night. Towards the end of the day one of my team members added a rule to an existing routing rule. When he had hit saved, he got a warning that he would overwrite someone else's changes. He hit cancel, then was able to click save. What he did not know is that there was a syntax issue in his rule that he had put in. He was missing a { that wasn't caught till hours later.

So a couple of questions have come up from this...

1. Why did the system did not catch this error when he clicked Save in the Routing editor, if Save is supposed to Save/Compile the code?
2. Why would a syntax error on the last rule of this Routing Rule cause the whole Routing Rule to not work? As my team members spent time after fixing the syntax re-sending all messages that go through the routing rule so it would get to the appropriate Operations

Thanks

Scott
