ECP Connection to remote data server

Hello,

I work on deploying IRIS inside Docker container. I really like %Installer class can automate many steps. I want to establish an ECP connection to a mirror database and then define a remote database on the application server. I have already seen we can create local database and namespace in %Installer. What code is needed to establish ECP connection?

#Coding Guidelines #Databases #Deployment #ECP #Mirroring #InterSystems IRIS
