Fast disable Interoperability ?

When I start a fresh installed IRIS or a Container I always find Interoperability (aka. Ensemble) mapped to namespace USER.

Is there any utility to remove this mapping by a click ?

unmapping it global by global, routine by routine, Package by Package is just a boring exercise.

To be clear: I look for a utility inside IRIS.

The external utility is obvious: Notepad (or any other text editor)

- clean iris,cpf,

- restart IRIS

It's fast, it's efficient, but it's really hardcore.
