How to call custom persistent class when any Error, Alert or Warning created into EnsUtil.Log table

Hi All,

I have created a custom method into persistent class to call vendor Rest API from Ensemble that is working fine through Terminal, but my concern is:

I want to call only if Error, Warning or Alert are generated. Is there any way that it would call automatically to send that Logs records through API or from where I need to call custom method of persistent class.

I also tried to put that persistent class method from Ens.Util.Log class but it's calling multiple time automatically.

Thanks,

Asif
