SQL Cached queries

Since IRIS 2020.1, changed the way how [embedded SQL compiled](#). Now it compiles upon the first execution of such queries.

Is there any way, I could switch that feature back to the previous behavior, or get some more control over it?

We deliver our software as deployed, and we would like to have it well prepared. Another solution would suit us, if we could change the generated classname of the cached query to something which we would be possible to map. At the moment it generates classes %sqlcq.NAMESPACE, but our customers may use different namespaces.
