View Application Error Log

Hi Community,

Is it possible to track Application Errors from a specific namespace?

With the new API, I know we have the endpoint /alerts.

But the endpoint /alerts, as described in the documentation:

The /alerts endpoint fetches the most recent alerts from the alerts.log file and returns them in JSON format.

I want to create push notifications for Application errors in specific Namespaces, and I don't know how to extract that information from there.

[System](#) > [System Logs](#) > [View Application Error Log](#)

Thanks,
Henrique
