Inbound File Adapter - Check Complete - File Locks

Hello,

I want to deploy Iris Interoperability Production in multiple containers . The production has File Services that process files from EFS location. All the files being processed by multiple containers are in the same directory. The standard Adapter class does not have Check Complete option to lock a file so that other containers File Services looking in the same file path cannot process the same file.

I updated the Inbound File Adapter class to offer another Check Complete option LOCK that will lock the file until it is processed and archived.

Has anybody else encountered conflicts when multiple containers process files from one directory?

Does anybody else think InterSystems should update the Inbound File Adapter class to support this requirement?
