Read CData of Webservice XML response

Hi all

Does anyone have an easy way of reading the cdata in the xml response returned buy a Webservice?

At the moment I have a XML class and then I use read.Correlate() to read through that XML bit.

However, depending on the message I have different things in the CData and I don't want to create a class for each one of these.

The API returns the cddata as KeyValueOfstringstring.

My idea would be to send to my method the cdata as a parameter which is the KeyValueOfstringstring part of the response message and then deal with it..

Any help would be appreciated...

Best Regards
