IRIS Data Platform Docker, OAuth2 and HTTPS

Hi!

we are evaluating IRIS Data Platform as an OAuth2 Authorization Server with the use of the official Docker image. We currently struggle with the OAuth2 setup, as we are required to use https:// for the /oauth2/authorize and /oauth2/token endpoints, but the Docker container exposes only http:// in its default configuration. We have tried to find any hints in the docs but were not successful. Any help is appreciated.

Thanks

Klaus & Lukas
