## adding business hosts programmatically to a pre-existing production.

Hello Guys, can you help me with a issue? I think it is a beginning question, but here goes, how do I add a new business host to production programmatically? for example a new business service or business process.

I've been looking at the documentation for the classes Ens.Config.Production, Ens.Config.Item and Ens.Director and I haven't found any method to add, maybe the name is a little bit different.

The idea is to create a class that will "deploy" or "configure" a new project components in a pre-existing production.

Best,  
Fernando.
