Best way to implement a one-to-one relationship

I know that 1-1 relationships are not officially supported by intersystems cache/iris so I want to know the best way to store data with this kind of data model.

Currently I have two classes that were implemented some time ago:

Table A with a relationship type one on table B

Table B with a relationship type one on table A

To compile I have a double compile with qualifier U.

What is the best way to implement a data model with 1-1 relationships?

Thank you
