Modeler

InterSystems IRIS is a complete platform to get insights from SQL and NoSQL data. It is possible to get data from Interoperability adapters or using a set of IRIS tables as data sources and model BI or NLP Cubes, covering all type of data (other tools are limited to SQL). There are the option to enable intensive analytics processing using Spark too. So you can model your analysis using IRIS web analyzers (many tools use desktop tools) and then visualize and produce insights using IRIS Dashboards and IRIS User Portal or your third party options, using open options like MDX and REST.
