InterSystems System Alerting and Monitoring v1.0 GA (Generally Available)

GA releases are now available for the first version (v1.0) of InterSystems **System Alerting and Monitoring** (InterSystems *SAM* for short)

InterSystems SAM v1.0 provides a modern monitoring solution for InterSystems IRIS based products. It allows high-level views of clusters and single-node drilled down metrics-visualization together with alerts notifications. This first version provides visualization for more than one hundred InterSystems IRIS kernel metrics, and users can extend the default-supplied Grafana template to their liking.

V1.0 is meant to be a simple and intuitive baseline. Help us make it great by trying it and sending us feedback!

SAM can display information from InterSystems-based instance starting with version 2020.1

SAM is only available in container format. You will need the SAM Manager container plus a small set of additional open-source components (Prometheus and Grafana) that are added automatically by the composition file. SAM components and the SAM Manager Community Edition are available from
The [WRC Components page](#) as "SAM Components" and the [WRC Containers page](#) as "SAM Manager"
Externally via the [Components Github repo](#) & the [Container page](#)

Documentation can be found [here](#).
