## VS Code InterSystems Objectscript extension version 0.8.7 no longer connects to server

My VS Code plugin "InterSystems Objectscript" upgraded to version 0.8.7 but the server settings no longer visible in extension settings and can no longer connect to our InterSystems server.

What has changed and how do we set the server connection up? I checked the JSON file and it still has the settings as it was before but it is not connecting.

Screenshot of the settings json and then on the left a timer icon on the InterSystems icon and blue line running from left to right at top as it tries to connect to server. I downgraded to version 0.8.6 setup settings again as before and it connects, there is nothing wrong with my connection to the server, it is the extension.
