How to Retrieve Data from Journals for Killed global in CACHE

Hi,

We are using CACHE 2017.2.1, I would like to retrieve data from Journal for killed global. Let say we have global name ^EMP(123) with data and also have some child nodes and it has been killed by using cache kill command for some reason and we don't know who has executed this and when. My questions are below.

- 1) Can we get back the data of killed global from journal files, Is it possible or not ?
- 2) If above question is Yes, then how to find that specific journal file, which has the global which has been killed?. I am assuming do we have to search journal files created on that date or date range.

[#Globals](#) [#Journaling](#) [#Caché](#)
