## How can I add an application server to ECP client list in code?

I was able to define ECP connection in Installer class that I run when I build docker image for my Docker IRIS application. Now I start to use Amazon ECS and Autoscaling. When a new instance is created and it runs the IRIS container, I want it to "register" as an Application server on the remote database server. What code can I execute to add an ip address as an Application Server?

[#Application Server](#) [#ECP](#) [#ObjectScript](#) [#Caché](#) [#InterSystems IRIS](#)
