## List of custom items in %SYS namespace

Dear community

I'm using HealthShare on Cache 2017.2. I'm trying to find out how I can get a list of all the custom classes, routines and globals in %SYS namespace (if it's even possible).

We're about to perform an upgrade, and in the docs it mentions needing to check for anything custom in %SYS to avoid important stuff being overwritten. Some of our solutions have been developed by an external consultancy and we want to make sure that none of their code or data will be affected by the upgrade.

In TSQL there is an "ismsshipped" column, and I'm wondering if Cache has anything which does a similar job, or that gives required results.

Thanks

Marcus
