how to compare the first part of global replacing segment

From my recent post, I uploaded a set of values into a global, and I am trying to compare the first field, and then

```
$GLOBAL("123", "bone issue")=""
```

```
$GLOBAL("234", "joint issue")=""
```

Now, I want to compare and see if the DG1:4.1 segment has the code \$GLOBAL and then replace the DG14.1 segment with the code and the description

so For Eg: if DG1:4.1 exists in \$GLOBAL("123") then replace the segment with the code and description

Can someone guide me on how I can achieve this?
