## Unescaping a HL7 field in a transform and set to a variable

I need some help with unescaping a value in TXA 2 of an MDM message that I am writing to a variable, to be used in a filename for a PF. Would I use the method Unescape(pData) if so how can I use it in a transform to set the variable? The reason I need to do this is I need to use the name as file name when writing the PDF to a directory. The escape characters are invalid for file names .
