Kerberos WebGateway

Hello

Is there an example how to configure the webgateway on linux with kerberos in the dokumentation I found something but not realy in detail so far I understand I need two priniples one service prinple account with for example iris/at-mie-centosiris.balmie.local@BALMIE.LOCAL -> there is my first problem with the dokumendation the @BALMIE.LOCAL is not dokumented but if you create a keytabfile with ktpass you can't create this without domain. For the secound user principle I am totaly lost how it should work must be both account in the keytabfile? and if so how can I connect this princple to the IRIS user because @BALMIE.LOCAL is not allowed as username

best regards

Hannes
