Combinatorial optimization implementation

Hi!

I need to solve a combinatorial optimization problem, like the [Knapsack Problem](#).

I found some [implementations](#), but they're memory inefficient. I also found libraries like [this one](#) from Google.

However, first I'd like to ask you guys for your experiences doing this kind of task in Caché/IRIS platform. Do you guys have implemented your own code or used a third party library?

Thanks,
José
