Securing your Management Web Portal moving from http:// to https://

I was wondering if there was a certain procedure or documentation on securing (Https://) the Web Portal into IRIS/Ensemble?

Currently we are using LDAP Delegated Authentication to access the Web Portal using LDAP. However as more and more emphasis is put on securing applications within networks, I can see Management/Security asking us to make sure that the web portal is more secure.

Maybe I am not looking at the right place for documentation, but is there a Best Practice guide, set of instructions, or Online learning that can help guide me in trying to make our environment more secure?

Cache for UNIX (IBM AIX for System Power System-64) 2018.1.3 (Build 414U) Mon Oct 28 2019 11:24:02 EDT [HealthShare Modules:Core:15.032.9026 + Linkage Engine:15.032.9026]

Thanks

Scott Roth
