How to Create a Cache SQL Temp Table?

In MS SQL Server i can do this:

```
SELECT  
Category, CrewNumber, MedicalCertificationDate, Seat, SeatbeltUsed, Sex, ShoulderHarnessUsed,  
ToxicologyTestPerformed, childsub  
INTO #tempfemale  
FROM Aviation.Crew  
WHERE Sex = 'F'
```

The code would create a new temporary table with the fields defined from Aviation.Crew. I cannot find how to do this in Cache SQL in the documentation. Can someone show me the correct syntax or other solution? This is a very simple example but i have very large tables with a lot of fields that require numerous filters and where clauses, having this type of mechanism would be extremely useful.

Thanks --
