VS Code Extension Pack for ObjectScript development is now available

Today we are pleased to publish a new extension pack for Visual Studio Code. This pack provides a convenient way to install and manage a set of extensions which together make VS Code a great tool for ObjectScript developers.

When you install an extension pack VS Code installs any of its members you don't already have. Then if you ever need to switch off all of those extensions (for example, in a VS Code workspace on a non-ObjectScript project) simply disable the extension pack at the desired level. Member extensions can still be managed individually.

Ways to get the extension pack:

- In the Extensions view within VS Code use the search string @ id:intersystems-community.objectscript-pack
- On Visual Studio Marketplace
- Via Open Exchange
