Does sql query from CSP that causes web pages to timeout get logged into SQL Statements ?

Hello,

I have a csp that occasionally will show Timeout error.

I am looking at the SQL Statements tab of the SQL Explorer:

Catalog Details	Execute Query	Browse	SQL Statements
-----------------	---------------	--------	----------------

All SQL Statements in this namespace

Filter: Page size: 100 Max rows: 10000 Results: 4249 Page: 1 of 43 Refresh

#	Table/View/Procedure Name(s)	Plan State	New plan	Natural Query	Count	Average Count	Total time	Average time	Std Dev	Location(s)
---	------------------------------	------------	----------	---------------	-------	---------------	------------	--------------	---------	-------------

The Average time is around 1.4, what would cause the CSP page to timeout if the query average time is 1.4 while the CSPGateway Server Response Timeout and Queued Request Timeout are default to 60 seconds? Does sql query from CSP that causes web pages to timeout get logged into SQL Statements ?

Thanks
