Terminal replacement

Hi

Has anyone found a good terminal emulator replacement for Cache Terminal?

We want one where the up arrow works to bring back the last command typed (without extraneous characters appearing at the beginning of the line) and be able to run D ^JOURNAL and have it display correctly.

I tried WebTerminal a couple of years back and but it didn't work properly with the journal. I've tried RoyalTS and that doesn't do up arrow or the journal correctly even though it's supposed to be emulating a VT400.

Any suggestions?

thanks
