Managing workers & categories for %SYSTEM.WorkMgr

Hi,

I'm trying to access the categories configuration for the WorkMgr via COS, so I can be able to create new categories for our processes and this way try to overlock the limit of cores*2 workers. I've seen that last version of IRIS is supposed to have a menu on the portal (System Administration > Configuration > System Configuration > WQM Categories), but since we are in 2020.1 this doesn't exist.

Does anyone have experience with WQM.API to manage the categories, or the usage of ^%SYS("WQM") to set it directly?

My goal is to be able to go beyond the limit of cores*2 that currently is in the "standard" category, therefore we can assign different categories to the different processes.

Thanks a lot
