Validate SDA before saving to ECR

We have some code written by earlier team that read flat files data and create SDAs and push them to ECR Input Service. Now for every test cycle we have to load files to SDAs, check error log, fix the error, clear the ECR, and try new fixed flat files. I'd like to know if there is a method to validate SDA msgs prior to pushing to ECR Input operations ?

so everything we simple load flat files, create SDAs and validate them. If files all looks good with no SDA erros then we actually load them to ECR only once.
