Problem trying to execute sqlproc inside multiple folders/package

Hi,

I seem to be able to execute sqlproc using the convention defined here <https://docs.intersystems.com/latest/csp/docbook/Doc.View.cls?KEY=GSQLq...> provided the package/folder is a single level. As, soon I have a nested folder structure I get an error while trying to execute this.

For instance,

```
select id, Utils.UsersgetRole(id) roles from users.users
```

works fine while,

```
select id, com.xyz.utils.UsersgetRole(id) from users.users
```

does not work and gives, "User defined SQL function ... does not exist"

I am on Cache 2017. Is there a workaround to making this work?
