## open an interactive window from within a running jobbed Cache routine

I like to be able to call an "autohotkey" executable message box from within a running Cache routine executing as a jobbed routine. The autohotkey executable displays a small pop-up window with a message and an "OK" button .. and will time out in 10 seconds if the user does not press the OK button.

Although \$ZF(-1,cmd) executes (where "cmd" contains a simple batch command e.g. @c: /autohotkey /warning.exe), no interactive window appears and, once the autohotkey routine times out, the calling cache routine simply continues.

I am not a very sophisticated Cache developer and I'd very much appreciate as simple an approach as possible... or even know if this can be done at all or not

Thanks in advance  
Doug
