Export Member Demographics from Registry upload to new gateway

I am hoping I explain this correctly.

We are using a query expire edge, to pass an API request to one of our vendor systems.

There is no feed into the gateway from an external system, and it is only used to query the external system with member data.

However, it is our understanding that the member needs to be registered on the edge.

Wondering if there is a way to export from the registry the bare demographic info in SDA to import to the new edge?

If anyone has done this and can point me to the right direction (documentation ect...) it would be greatly appreciated.

Thanks,

Ed
