Debugging: Lost/Missing debugging functionality

I have multiple projects that I utilize when debugging in Cache Studio. One of my projects suddenly lost the ability to step through commands with the yellow box and the cursor moving though code lines. The cursor just sits at the entry line while variables apparently do change. Interestingly enough, if I change the project and the debug target, the "yellow box" ability is still there. Apparently losing this functionality is by project/debug target/whatever. The goal is, of course to return it back but how?
P.S. Maybe it is some odd Cache Studio registry corruption or some Cache system global corruption? Just a guess. I did see this problem before a long time ago.
