Zen Table pane: Can I update a row in the table pane?

I am able to display my query result in the table pane, but I want to update it based on user click but it doesn't work. Can this be done? Below is what I am doing but it doesn't change my value on clicking. Would appreciate some guidance on this

I have ondblclick = zenPage.SelectItem

```
ClientMethod selectItem(id, time) [ Language = javascript ]
{
```

```
    table = this.getComponentById('tablename');
    var data = table.selectedIndex;
    var rowval = table.getRowData(data);
    var valuep = new zenProxy();
        valuep.TXTFLAG = rowval["TEXT"];
    zenPage.ToggleTextFlag(pP);
```

```
    var table = this.getComponentById('tablename');
    table.executeQuery();
}
```

```
ClassMethod ToggleTextFlag(bData As %ZEN.proxyObject, act As %String) As %Boolean [ ZenMethod ]
```

```
{
    if bData.TXTFLAG = "Y"
    {
        s bData.TXTFLAG = "N"
    }
    else
    {
        s bData.TXTFLAG = "Y"
    }
}
```

```
Set tSC = 0
```

```
Quit tSC
}
```

```
